KRISHNA CHATURTHI

87% lit, waning

On the sky, discs are sized from real apparent diameter, log-compressed: at true scale Mars would be four thousandths of a millimetre. Hollow means under the horizon at that minute, so it appears on the ring only — the ring carries all nine, the sky carries what was actually over that roof. Rahu and Ketu are the points where the Moon's path cuts the ecliptic, not bodies: there is nothing there to see, at any size.
